

BRAHMOS

Prime Strike Weapon of Indian Navy in Naval Warfare

India is progressing swiftly to become a great maritime power and secure its strategic advantage in the Indian Ocean Region and the broader Indo-Pacific region. The Indian Navy, which plays a crucial role in safeguarding country's maritime interests and maintaining peace and security in the region, is also enhancing its capabilities and preparedness to remain a modern and combat-ready force, with key focus on acquisition of state-of-the-art systems and advanced technologies powered with innovation and indigenisation.

Today, with a well-balanced maritime strength, the Indian Navy possesses cutting-edge naval platforms and weapons of formidable range. One such potential and universal weapon system in the Indian naval armada is the BRAHMOS Supersonic Cruise Missile. The ultimate weapon system has proven its invincibility time and again, as the world's fastest cruise missile to annihilate high-value enemy targets. With unmatched speed, pinpoint precision and devastating power, the BRAHMOS missile has emerged as a game-changer in naval warfare.

Since 2005, BRAHMOS surface-to-surface missile, with both land-attack and anti-ship strike capability, has been successfully integrated in many frontline warships of the Indian Navy, providing it with unparalleled flexibility in combat scenarios. The ship-launched anti-ship variant was the first supersonic cruise missile to enter service in the Indian Armed Forces. The universal BRAHMOS, as Navy's "prime strike weapon", has consistently proved its mettle through numerous successful test firings from Indian Naval Ships, in either inclined or vertical configuration based on the type of platform.

The missile has also proved its 'salvo' launch capability to knock down single or different targets located in different directions. BRAHMOS has also proved its prowess from an underwater platform.

BRAHMOS, initially conceived and developed as an Anti-Ship Cruise Missile system, has evolved over the years and added many more variants - from sea-to-land, sea-to-sea, land-to-land, land-to- sea, sub-sea-to-land, sub-sea to sea and air-to-land configurations. The universal missile can be fired either from static, mobile platforms (land & sea) or fighter aircraft, in solo or salvo mode. This multiplicity makes the weapon all the more versatile in taking on the enemy anywhere, anytime. Indian Army, which became the first land force in the world to deploy the deadly BRAHMOS in 2007, has raised several regiments of the formidable weapon in different configurations. The Indian Air Force's (IAF) frontline fighter aircraft Sukhoi-30MKI, has successfully demonstrated BRAHMOS missile's firing capability. With all these incredible feats and traits, BRAHMOS today has become the most formidable military asset in modern network-centric warfare operations.

BrahMos Aerospace has immensely contributed to the Nation's growing defence and industrial base by involving the consortium of public-private industries, R&D labs and academic institutions, which have made significant contribution in design, development & production leading to the induction of BRAHMOS in the Indian Armed Forces. The organisation also possesses a full-fledged design centre, an Industrial Consortium for producing different sub-systems, a world-class integration, and check-out facilities with stringent quality control.

The missile system is growing from strength to strength in nation building. In its pledge to the "Atmanirbharta in Defence" mission, BRAHMOS has achieved historic milestones in the flagship "Make In India" programme thus empowering defence indigenisation and self-reliance in defence production. BrahMos Aerospace now aims to take it to the next level by designing and developing even more lethal and powerful variants of the existing weapon.

The emergence of such a powerful, universal weapon has also made it a potential contender in the international defence market with several countries across continents strongly willing to acquire BRAHMOS for their military. Regarding export of missiles to friendly foreign countries, the landmark BRAHMOS export contract with Republic of the Philippines has paved the way for more such missile orders.

BRAHMOS supersonic cruise missile has been indomitably scaling greater heights of success since its inception in 1998. The BrahMos Joint Venture (JV), a unique role-model between India's Defence Research & Development Organisation (DRDO) and Russia's JSC MIC NPO Mashinostroyeniya (NPOM), has today become a shining example of military and technological cooperation. The supersonic cruise missile with its multi-role capability, universality and utmost lethality, has carved a distinct place for itself in the Indian Armed Forces. The weapon stands out as the only universal supersonic cruise missile system in the whole world with the capability of neutralising Land or Sea based targets.
