schools and those at the bottom, with a 562-point difference out of a total achievable score of 1,000, an increase from 319 points in the previous year.

Amid these challenges, leading B-schools are rising to the occasion and revamping their pedagogical approaches while embracing technological innovations. The era of static, theory-heavy learning is giving way to dynamic, technology-driven education models that lay great store by practical skills and adaptability. Business schools now face the critical task of preparing students not just for today's corporate environment, but for the workplaces of the future.

With automation and AI reshaping industries like manufacturing, finance and marketing, recruiters are looking beyond conventional MBA qualifications. They want graduates with specialised skills in areas such as data analytics, cybersecurity and supply chain management. And since companies are increasingly beginning to hire for specific job functions rather than educational backgrounds, B-schools have to ensure that their programmes pivot to the demands of this rapidly changing job market.

And the very AI that is disrupting businesses is also becoming integral to teaching methods and student learning experiences. Business schools are exploring personalised learning tools powered by AI, virtual simulations and data-driven teaching strategies. This integration of AI into learning processes prepares them to apply theoretical knowledge to practical situations and engage with real-world business challenges. More than just a subject to be taught, AI is becoming an indispensable tool to deliver business education.

Another pivotal change has come
