and AI research, creating the vital enabling infrastructure of AI compute, quality and diverse datasets that go to training Indian models. The defining theme is that it is built on the ingenuity and enterprise of young Indians combined with the enabling support of the government and its policies. The most important determinant of IndiaAI growth and success will be talent. We have a huge repository of AI talent, a fact emphasised by Stanford University's AI index—it says India leads globally in skill penetration in AI, even outpacing the US.

India is the world's largest connected democracy. With rapid digitalisation of our economy, it is also creating unprecedented quantities and diversity of data and datasets. Currently, we are building in the India Datasets programme one of the world's largest and most diverse datasets, poised to significantly benefit our research and start-up ecosystems. A robust policy and legal framework will also make the programme an important competitive advantage for IndiaAI, for it will stop unauthorised entities and countries from developing AI using India Datasets.

GPAI Summit 2023

The GPAI summit under India's chairmanship has reaffirmed the international recognition of AI's profound impact and represents an important landmark in the discourse on global AI. Attended by 28 nations, it focused on three key points—Inclusion, Collaborative AI and Safe & Trusted AI. The declaration represents India's commitment to inclusive technology—ensuring that all nations, especially from the Global South, have access to AI, to use for their peoples' benefit. It stressed on collaborative AI between countries in healthcare, agriculture, education, etc., and the need for a global framework to define and regulate safe and trusted AI.

The traditional narrative of technology has been around two sharply differing frameworks. One assumes markets will regulate innovation, the other, European, model is prescriptive and focused on protecting citizens' rights. Led by India, there is a new framework that is developing fast, built around not viewing markets/use cases and protecting citizens as binaries. India's approach is influenced by our PM's rubric—being fully invested in catalysing innovation whilst building guardrails and rules to ensure innovation is safe and trusted.

Over the past two years, India has steadily built this framework in the innovation and digital economy with IT rules and laws. This type of framework of safety and trust as obligations cast on platforms, including AI ones, is finding global acceptance. As was agreed at the GPAI, countries recognise the need to move fast.

India's approach involves establishing principles and a comprehensive list of harms and criminalities related to AI. Instead of regulating AI at specific points in its development, India favours setting clear guidelines for platforms, with a focus on addressing issues like bias and misuse during model training. The proposed framework involves defining prohibited actions, with legal consequences for non-compliance. In the Indian context, existing IT rules have set the stage for addressing challenges related to subjects like deepfakes (misinformation powered by AI). The amended Information Technology Act rules focus on platform obligations.

Platforms are obligated to prevent the dissemination of misinformation in any form, and Rule 3.1B specifies 11 issues that platforms must not allow, including child sexual abuse material and content that could incite people. Violating these rules exposes platforms to prosecution under the Act, as the safe harbour protection would be forfeited. This comprehensive regulatory approach aims to balance innovation with the responsible and ethical use of AI on a global scale.

Future Vision

Our goal is for IndiaAI to play a significant role in shaping the future of global AI. Over the past nine years, India has transformed from simply being a consumer of technology to a country that is determinedly creating its technologies, devices, products, solutions and is a trusted partner/co-developer in shaping the future of the Internet and Tech. We will do so always remaining true to '*Vasudhaiva kutumbakam*' and inclusion as we have shown with our DPI solutions that are accessible to all countries.

We are certainly living in exciting times for the world and, in particular, India. From the Fragile Five economies, we have risen to be in the Top Five. Being amongst the Top Three economies is around the corner. Being a trillion dollar digital economy and among the top innovation and digital economies is also within reach. ■

TAKEAWAYS

- India's AI line is catalysing innovation but with rules to ensure trust, safety
- 'IndiaAI' vision will support the building, expansion of AI start-up ecosystem
- Amended IT Act sets clear guidelines for platforms on bias and misuse
