

RAJWANT RAWAT

I see AI as a source of free intellectual energy. Let's open it up for our young minds. They can then access the highest quality education customised to their level of understanding in months, not years. Delivered right to their home, in their native language, almost free of cost

of education—from curriculum to pedagogy to delivery—hasn't kept pace with enrolments. This is true at all levels of education—primary, secondary and college. At college level, education must be linked to employability. Most recent data show youth unemployment to be at 16.5 per cent. In five years from now, we must aim to reduce our youth unemployment to no more than 5 per cent. This has to change dramatically, and quickly.

If we use it seriously, AI can help us here. In a matter of months, not years, our children could have access to the highest quality education customised to their level of understanding. Delivered to them right at their home, in their native language, almost free of cost. This is distinctly doable because India has one of the finest examples of public digital infrastructure in the world. I hope the government, NGOs and tech companies in India join to bring such solutions to every student. I see AI as a source of free intellectual energy. Let's open it up for our young minds.

Thirdly, how we deliver the best healthcare to the remotest Indian village is the next big challenge. India has been late in understanding the direct correlation between human capability and human capital. Healthcare, along with education, is the essential ingredient for converting our biggest capability into our best capital. For the next five years, we should aim to achieve the following two:

- Bringing down our infant mortality rate to five per 1,000 live births from 25 right now
- We have done a remarkable job in bringing up our life expectancy from 32 years—at the time of Independence—to over 70 years right now. But now we have to focus on healthy life expectancy, not just life expectancy. India is the capital of just too many diseases.

Like for education, for healthcare, too, I think, AI may be a godsend for India. It allows an inexpensive and fast way to combine the 'practice of medicine' with the 'science of medicine', which is what we need to deliver—the best quality primary care to the remotest places in India.

Fourth, from 'Make in India', we should move to 'Make better than the best in India'. By this, I mean we should be setting world standards. For example:

- We have in India one of the world's biggest and most efficient oil refineries
- Some of our seaports are the most modern and our airports are world-class.

At the turn of this century, how many of you would have imagined India would be exporting automobiles and being home to building the highest quality smartphones? Thanks to developments like 'China Plus One' and policies like 'Make in India', we have the tide in our favour that can take us from 'Make in India' to 'Make better than the best in India'. We have what I would call the "last mover advantage". We can start with the latest technology, especially now that we are getting into semi-conductor manufacturing. I think we are at the cusp of a golden era in Indian manufacturing.
