a digital transaction. It has become a marketing case study. The media needs to highlight their hard work.

Many people may not know of the NAMO Drone Didi Yojana. Women self-help groups in villages were handed over 1,000 drones. These are not the drones you see on TV, these are drones that will change the fortunes of villages, farming and women. **Women in the villages, who would never have ridden a bicycle, are now recognised as drone pilots.** Even today, if a girl is seen driving a tractor in a village, people see it as an anomaly. I want to break this psyche. And this is my way of changing rural mindsets. **I believe when women in villages will fly drones, work in the fields, they will change the economy of agriculture.**

My life experiences inspired me to start the PM SVANidhi Yojana. I have seen the richness of the poor and the poverty of the rich. That's why I found the courage to give street vendors loans without any guarantee

When I was in Gujarat, I decided that ASHA and Anganwadi workers would have even better uniforms than those of air hostesses. Earlier, when they would see a policeman, people in the villages would see him as the face of the government. The change in uniforms of ASHA and anganwadi workers meant that villagers started seeing them as the *sarkar* too. I had the same thing in mind when I launched the NAMO Drone Didi campaign.

You must have heard about the Ayushman Bharat Yojana, which provides free medical treatment of up to Rs 5 lakh. **If you visit a village today, you will find one more thing—Ayushman Arogya Mandir. It has been our endeavour to ensure every block in a village has a modern healthcare facility. That is why we have built more than 1.5 lakh Ayushman Arogya Mandirs in villages.** Some people may have a problem with the use of the word mandir, but that's their problem, not mine. Not only can you get normal tests done at these arogya mandirs, but also initial tests for diabetes and cancer. We are also trying to digitally connect them to big hospitals so that people in the villages can also avail seamless treatment. **Today, we are using telemedicine. This is a digital revolution. The eSanjeevani app has helped people access 240 million consultations sitting in their homes.**

In the past 10 years, we have developed an entirely new model of governance. We have focused on those who were at the very bottom of government priorities. As soon as we formed the government, we launched a campaign for the development of more than 100 backward districts of the country. Thanks to the Aspirational District Programme, these districts have overtaken many others on several parameters today. Now we will replicate the success in the districts at the block level. We have already begun the Aspirational Block Programme.

India's Northeast was always last in the priorities of past governments. **Since 2014, central ministers have visited the region nearly 700 times. As prime minister, I have visited the region more than the number of times previous prime ministers put together would have gone.** We changed mindsets. Districts that were earlier dismissed as backward are now renamed aspirational districts. Villages that were earlier seen as India's last villages are now called the country's first villages. In the east, these are the districts where the rays of the sun fall first; in the west, that's where the sun takes leave. It has been a year since we launched this scheme. In this time, 17 cabinet ministers have gone to these remote villages and spent a night there. In some villages, the temperature was minus 15 degrees [centigrade]. Do we do this to win elections? Villages that have a population of barely 50-100, where it takes three days to reach? We do not do it for votes. Elections come and go, this is our commitment, our responsibility.

When a government's focus is clear, it shows all around. We have created separate ministries for skill development, animal husbandry and fisheries and the cooperative sector. And the results have been like we wanted them to be. By skill development, I target Industry 4.0. It's not about tinkering with a screwdriver in your garage. **India's fish production has doubled today. Our fish exports today are nearly the level of our software exports.**

You all know about the Covid vaccine because your own life was at stake. But **I have, for the first time, launched a Rs 15,000 crore scheme for the vaccination of animals. My ultimate mission, which I want to promote globally, is to fulfil our commitment to One Earth, One Health. Be it the health of a plant, an animal or a human.**

For the first time, fishermen and livestock herders can avail the benefits of Kisan credit cards. **Under the ministry of cooperation, more than 60,000 Primary Agricultural Credit Societies (PACS) in villages have been computerised. The same ministry has started the world's largest storage scheme. Work is on for two lakh godowns. Because of these, farmers will not be forced to sell their produce, they can keep it in the godowns, and sell it when market prices improve. Income will be assured, and wastage minimised.**

During previous governments, you would not have heard of "ease of living". Since they did not think in those terms, how could they possibly provide it to citizens? In the time of earlier governments, the powerful, the capable staked the first claim to government services. They'd use every trick—*saam, daam, dand, bhed*—influence and bribe too, if needed—to corner these. And who would suffer for this? The common man. The one that we knew from the
