be implementers of such crucial change has become one of the key projects of the company. Pernod Ricard India has 3124+ women being engaged in SHGs (self-help groups) programs, and 400+ women supported with Nano-horticulture and vegetable plots. These endeavors have led to a range of ₹20,000 to ₹50,000 income increase through vegetable plots in women's hands. Over the years, the company has taken pride in the 7,400 Native Trees and 1,73,000 trees in agricultural forests that have been planted to date.

Ensuring that local communities involved in the production procedure feel empowered to chase sustainable goals is vital for any business striving to be effective in its sustainability efforts. In line with Pernod Ricard's social purpose and vision of "Transforming Communities and Accelerating Local Development", Pernod Ricard India enterprises the community penetration programs with pride. These programs have reached more than 1000 villages, spanning nearly 25 of their plants across India. A considerable change through investigative analysis has proven the impact having benefited 2.2 million lives in the past two years, with 110+ programs. Local communities driven by the aspect of sustainability not only empower the people and the landscape but greatly aid the workings of the company which benefits through its vested community. Pernod Ricard prioritizes equitable talent processes, convivial culture, innovation & growth, and enhanced reputation. An empowered community enables a charged-up dynamic work environment that improves business performance.

WATER CONSERVATION: A KEY GAME CHANGER

To preserve water, Pernod Ricard has established 5 key principles at each step of its product lifecycle: Rethink, Reduce, Reuse, Recycle and Respect. These steps are crucial to the sustainability ethics of Pernod Ricard. PRI's initiative 'Circular Making' tackles two key sustainable development goals as laid down by the UN. 'Life below water' and 'Responsible consumption and production'. To meet these needs, the corporation has taken several measures. They recycle and reuse the treated wastewater on their premises with technological intervention. Having replenished 1.2 times more groundwater than it withdrew in 2019, PRI became a net water-positive company and has rapidly scaled up its drive ever since. It hopes to replenish 2.6 times water this year. The firm is devoted to reducing carbon emissions by 33% per unit of production. To achieve this, they have taken measures like switching from fossil fuel (coal) to biomass for their distillery operation and reusing shipper cartons. This has led to a significant reduction in carbon emissions and waste material through the manufacturing process. Numerous other measures like the installation of rooftop solar plants that promote more renewable electricity, 100% recharging of the rainwater within and beyond the fence in high-stressed areas of operation and engaging in EPR for 100% of the plastic material used in packaging have aided in significant changes.

A VISION FOR A SUSTAINABLE FUTURE

Protecting the environment, while also initiating healthy business practices has been central to the ideology of the firm. In hopes of a better future, various projects have been launched. In May 2022, an initiative to remove mono-carton packaging from their brand portfolio was launched. This was done with the hopes of removing an estimated 500 million pieces of permanent mono-cartons annually. A move towards a greener future can only be established through a holistic approach. Through the reduction of carbon emissions every year by 7310 tonnes, saving 2.5 lakh trees, and achieving water positivity the company attempts to shrink packaging emissions equivalent to 30,000 tonnes by 2030. Pernod Ricard India also hopes to curb GHG emissions by refining their energy efficiency, and renewable energy, and bringing circularity in their operations.

With a vision rich with sustainable plans for the future, Pernod Ricard India hopes to forge new sustainability grounds. They dedicate themselves to future endeavors ensuring zero waste to landfill operations by reducing, recycling and responsibly disposing of waste. They are also looking to test local models for regenerative farming systems in the Group's vineyards in 8 wine regions by 2025. As a company that prides itself on its sustainability ideals, it actively seeks more opportunities for growth towards sustainability through many sectors. Areas like renewable electricity with solar, wind, and PPA, and new technology integration in wastewater treatment provide rich spaces for work and development. There is also a focus on regenerative agricultural practices through CSR intervention. New technology integration right from the design phase for upcoming distilleries is set to use renewable energy sources (biomass) and best-in-class water and energy efficiency. The evolution concerning green hydrogen and its usage later in operations, along with electrified boilers running on 100% renewable electricity, further highlights Pernod Ricard's emphasis on contributing to a sustainable future.

Pernod Ricard India has perennially strived towards the upkeep and protection of the environment through its effective implementation of sustainable development goals. Over the years, it has grown in this sector through precise initiatives and practices in all facets of their workings and the results are an efficient representation of these efforts. Through its practices of Removal of permanent 'Mono-cartons' from its packaging, 'Water conservation', and other 'Circular Economy' as highlights of several other micro initiatives, Pernod Ricard attempts to be a conscious and responsible enterprise, ideologically aimed at the race against climate change that the world indeed can win. This holistic approach underscores the company's dedication to creating shared value for people, planet, and communities in India, ensuring a sustainable and inclusive future for generations to come.
