DEVASTATING DIVYASTRA

THE SUCCESSFUL TESTING OF WARHEADS WITH MIRV TECHNOLOGY ON THE 5,000-KM RANGE AGNI-V MISSILE ADDS ANOTHER FEATHER TO DRDO'S CAP AND MORE TEETH TO INDIA'S NUCLEAR ARMS CAPABILITY

- The successful test of Multiple Independently-targetable Reentry Vehicle (MIRV) technology on the indigenously developed Agni-V ballistic missile system puts India in a club that includes the US, Russia, China, France and the UK. According to sources, three warheads using the technology were carried by Agni-V and tested successfully
- Pakistan claims its Ababeel missile has MIRV technology, but it is not independently verified
- MIRV technology was developed in the 1960s and deployed in the 1970s by the US (with the Minuteman III missile) and USSR (R-36 missile)

MIRV TECHNOLOGY
multiple warheads to be loaded on to a single ballistic missile, and be programmed to hit different targets, at different trajectories

Some 180 seconds after launch, the third-stage thrust terminates and the post-boost vehicle separates from the rocket

About 60 seconds after launch, the first stage drops off and the second stage motor ignites. The missile shroud is ejected

>5,000 KILOMETRES
Operational range with full payload of 1.5-tonne warhead

INDIA'S NUCLEAR TRIAD

LAND-LAUNCHED NUCLEAR MISSILES

Prithvi II (350 km), Agni-1 (700 km), Agni-2 (2,000 km), Agni-3 (3,000 km), Agni-5 (over 5,000 km). These are the missiles that have been inducted by India's Strategic Forces Command

STRATEGIC AIRCRAFT WITH NUCLEAR BOMBS/ MISSILES

Indian Air Force's Mirage 2000s, Jaguars and **Rafales** can carry nuclear gravity bombs

NUCLEAR MISSILE ARMED SUBMARINE

INS Arihant, India's first nuclear ballistic missile submarine (SSBN), is armed with 12 K-15 (Sagarika) sub-marine launched ballistic missiles (SLBMs) with a range of 700 km as well as Nirbhay cruise missiles
